Expojour launches the world’s first Server-Side Password Manager - for free!

An Ingenious Breakthrough in Password Security & Management

Naples, Florida – Common sense and internet safety protocols suggest we use a unique, complex password for each site we log into. Unfortunately, this also makes them virtually impossible to remember—and while that very fact has inspired a number of password management utilities, studies reveal they all have significant vulnerabilities and are frequent targets of hackers.

The newly launched and patented WordCrypt is the world’s first server-side method for users to easily and securely manage complex, encrypted passwords anonymously. WordCrypt requires no user registration, no user login, nothing for users to install on any device, and maintains no password or user database so there’s absolutely nothing to be hacked and stolen. In fact, even under subpoena WordCrypt could not possibly reveal users’ identities or their passwords.

WordCrypt.com offers a WordPress plugin and JavaScript module for webmasters to install for free on any website. The modules add a pulsing icon in the password field as a clickable option to entering a password. Selecting the icon launches an SSL popup window only visible to the user.

The way it works is ingeniously simple. Users type their own secret phrase and secret pin number and WordCrypt converts those values into a unique, encrypted password exclusively for that website.

“Come back in five minutes or five years,” says Expojour Founder Jim Lucas, “use your same secret phrase and pin number, and WordCrypt will generate that same unique, encrypted password just for you and that domain. It truly solves the world’s password problem for every site and user.”

Lucas, a former network tech (CNE, MCSE) living in Florida, was born abroad and raised in Austria, India, Venezuela, Argentina, Washington DC, Denmark, Turkey, China, Canada and the Philippines as the son of an American diplomatic officer and career cryptographer. A citizen of the world, his background mimics life online, where users are connected to the international community—continuously surveilled and vulnerable to worldwide threats.

WordCrypt is up and fully functional as Lucas reaches out to cybersecurity and identity protection companies to establish WordCrypt as a new global standard for simple and safe online password management.

“We take internet safety and online privacy very seriously,” Lucas says. “Like everybody else, our private lives and personal security depends on it.”
